

Flasher Can Location BN2

The flasher can on a BN2 mounts inside the car and has a mounting tab on the top which fastens over the end of a 1/4" NF machine screw whose head is in the engine bay, the shank is inside the car. The wires come from the main harness in the engine bay, through the same grommet as the 3 wiper motor wires, arriving right adjacent to the base terminals of the flasher can.

It's a whole lot easier to install all this stuff before the front shroud is final fitted to the car. Picture attached of original BN2 showing undisturbed details before dismantling. Shroud has just been removed.
