

## **Battery Cutoff Switch Tech Tip**

By Doug Reid

I believe the position of the cutoff switch in 4 seater cars subjects it to the worst vibration, just like if you ever sat in the very back of a school bus you got jolted the most of all passengers due to the distance behind the rear wheels.

This can be pretty hard on the switch.

**Most of the time when I connect that white wire with the black tracer to the cutoff switch I don't bare any copper wire, so the holding screw bears on insulation and makes it look correct without the wire actually being connected.**
