

## **Wiper Motor Repair Tip**

A common cause for the wiper motors not working is the fact that they are used so rare the grease inside the gear part of the motor get hard and then freezes the motor up. If you remove the four screws on the top plate you will get access to the gear assembly. Then remove the small c clip on the back side and remove the gears, clean out all the grease and then install some white lithium grease and close it all up.
